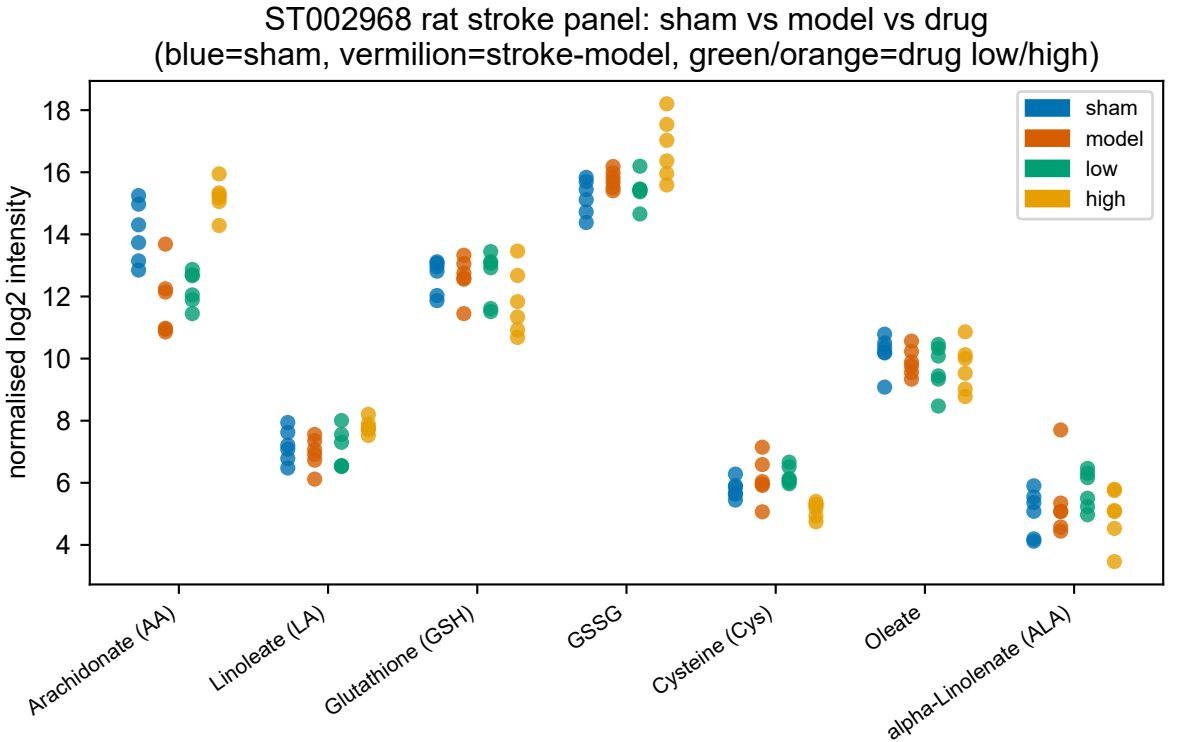
INDEPENDENT metabolomic corroboration (rat stroke model, MW ST002968); no paired transcriptomic HDFI.
This is NOT an SAH HDFI<->lipid proof.



Group difference summary

```
Model vs sham (fold-change):
  Arachidonate (AA)      log2FC(model/sham)=-2.23  (down; p=0.00866)
  Linoleate (LA)         log2FC(model/sham)=-0.23  (down; p=0.485)
  Glutathione (GSH)      log2FC(model/sham)=-0.02  (down; p=0.818)
  GSSG                   log2FC(model/sham)=+0.56  (up; p=0.132)
  Cysteine (Cys)         log2FC(model/sham)=+0.32  (up; p=0.18)
  Oleate                 log2FC(model/sham)=-0.29  (down; p=0.394)
  alpha-Linolenate (ALA) log2FC(model/sham)=+0.34  (up; p=1)

NOT measured in this panel (not fabricated):
  - 4-hydroxynonenal / 4-HNE
  - malondialdehyde / MDA
  - oxidised phosphatidylethanolamine (ox-PE)
  - hydroxy-eicosenoic acid (HETE/HODE)
```
