HDFI axis proteins at the PROTEIN level — SAH vs control CSF

XD030593 (Q Exactive Plus, label-free DDA LC-MS/MS; n=4 SAH vs n=4 control), total-intensity normalise

HDFI_protein = z(HMOX1) - z(FTH1+FTL) - z(GPX4): NOT COMPUTABLE at the CSF-protein level. HMOX1/GPX4 (also ACSL4, SLC40A1) were below detection in PXD030593 and are likewise absent from the independent larger cohort PMC11267790 (n=23 SAH vs n=10 control). Only detectable axis members are shown; nothing imputed or fabricated. Spearman rho range across detected axis: -0.40 to 0.67.
